Appropriate engineering controls

Engineering measures to reduce exposure:

Ensure adequate ventilation. Use process enclosures, local exhaust ventilation, or other engineering controls to keep airborne levels below recommended exposure limits. If user operations generate dust, fume or mist, use ventilation to keep exposure to airborne contaminants below the exposure limit.

Individual protection measures, such as personal protective equipment

Personal Protective Equipment

Eye protection: Goggles or Safety glasses with side-shields.

Skin and body protection: Long sleeved clothing
apron
Gloves

Respiratory protection: Effective dust mask. Use a dust respirator under conditions where exposure to the substance is apparent (e.g. generation of high concentration of dust (dust clouds) , inadequate ventilation, development of respiratory tract irritation), and engineering controls are not feasible. Be sure to use an approved/certified respirator or equivalent.

Hygiene measures: Avoid contact with skin, eyes and clothing. When using, do not eat, drink or smoke. Wash hands before breaks and immediately after handling the product

Delayed and immediate effects as well as chronic effects from short and long-term exposure

Chronic Toxicity Prolonged or repeated inhalation may cause emphysema, pneumothorax, and may produce small pulmonary radiographic opacities, but are usually not

fibrogenic. Some epidemiologic studies have shown excess nonmalignant pulmonary fibrosis or fibrotic changes in the lungs while other have not. May result in high levels of aluminum fibers in the lungs. Also, some reports attribute aluminum oxide exposure as causing pneumoconiosis. However, workers exposed to powdered alumina in the china industry for more than 15 years had no radiological signs of pneumoconiosis. Studies of persons chronically exposed to Aluminum Oxide dust have found a dose-dependent increase of aluminum concentrations in the blood and urine, indicating that systemic distribution of aluminum can occur from dust inhalation. Animal studies showed that the retention of aluminum in the lungs of rats depended on the exposure pattern, with more dust being retained with longer exposure to lower concentrations than from shorter times with higher doses. Ingestion or Inhalation: Aluminum can accumulate in the bone with consequent increased bone fragility and fractures. This could be due to inhibition of parathyroid hormone.
